Summary of the project file

This file retraces the stages of the realization of a set of applications, dedicated to internal and external use, carried out during my work-study program in the Unistellar company.

Initially, a period of integration into the company was put in place. Period during which were carried out: Getting to grips with the various tools, related to development or collaborative, understanding the needs of the company, their products and the solutions that can be provided, as well as taking into account the requirements of the company, constraints related to business logic, and specific requests from management.

Following this period, I was able to fully integrate the development process, and specific project-related tasks were assigned to me (features, bug fix, spike, etc.).

The development was mainly done on the front-end part of the applications, with the use of Reatct.js
